

ICD & Pacemaker programmers

Every manufacturer of pacemakers and defibrillators provides its own programmer for reading and programming of pacemakers and defibrillators. This programmer is usually suitable for a range of products of this particular manufacturer. This results in set-up of several programmers in the treatment rooms for patients with a pacemaker or defibrillator. This way the right programmer can be chosen for each patient.

A permanent arrangement of programmers on a cart, as shown in the image above, makes it easier to operate the required programmer. In this configuration all programmers are placed on fully extendable trays, making them quickly deployable. Because of the isolation transformer on the cart, all programmers can be enabled simultaneously in a safe manner.

Configurations

As a basic cart can be chosen from different models. All these models can be assembled as desired. For the placement of the programmers fully extendable shelves will be used:

- **Crozz two 2G 430**
This trolley is fitted with a rear door and can be extended with an arm for a monitor or Panel PC.
- **Flexx two 2G 43-100**
This is a lower model than the two Crozz 2G 430 and is not provided with a rear door. This cart is not suitable for mounting an arm for a display.
- **Flexx three 2G 1000**
This is a wider cart on which two programmers fit next to each other. This makes the cart suitable for compact arrangement of four or more programmers.

Interested?

Please feel free to contact us for information or a quotation. We'll be happy to assist you in finding the most optimum configuration.
